

## Reduce your waste by up to half - ecologically and according to regulations.

Waste management is an important part of the budget of each community. Containers for general waste are usually full of biodegradable waste (BW), which should not be there. So you end up paying for something you don't have to. **We know that on average 45% of general waste can be composted.** Districts are subjected to sort waste by law and this brings with it unexpected troubles. Join the communities that attend to solving their BW sorting responsibly. **Separating BW reduces the amount of general waste.**

Organic waste is organic material that is able to decompose in the soil. It binds to a large amount of nutrients, which can be put back into the soil as compost.

Leaves, grass, weeds, fruit and vegetable scraps, tea-bags, coffee grounds, plant residues, sawdust, wood chips, soil from pots, fallen fruit...

## Compost is a natural fertilizer that does not cost you anything.

Not sure **what to do with your biological waste?** The solution is simple – **compost**. Get quality and nutrient-rich fertilizer for your garden-beds, flowers, trees, vegetables and lawns. It's really easy – invest in a tasteful and functional garden composter and bin your waste from kitchen to garden. Avoid the smell and those unsightly piles of waste you're used to hiding in

the corner of your garden so as no one can see. **A quality composter is an excellent and practical tool for your garden!** A garden composter speeds up the process of composting by up to half the usual time. Special **electric composters can produce high-quality compost in just 24 hours!**

## FIRST STEPS IN BIOWASTE SEPARATION

### 1. COMPOSTING IN GARDEN COMPOSTER (households)

### 2. COMPOSTING IN ELECTRIC COMPOSTER (kitchens)
